## Internship

### Software-Development

So, you are passionate about software engineering and want to experience how theoretical concepts from your lectures are put into practice? We offer you the opportunity to implement the entire development cycle – from analysis to design, implementation and testing – on real tools for our company. Use your internship time to create something lasting and valuable.

If you would like to get to know other areas during your internship, such as hardware development, sales of software solutions or system administration, we can also make this possible for you.

Depending on which project we choose together, the following technologies may be used: JavaScript / TypeScript, Angular, NestJS, TypeORM, PHP, PostgreSQL, MySQL

Interested? Let's talk. Just give us an informal call and drop by for a coffee, tea or water...
